

(IMPORTANT) Measure the correct acrylic size

Common table or desk edge shapes:

The acrylic size you need is determined by the flat surface area of your furniture. See drawings for examples of where the flat surface typically ends in relation to the edge detail. It is very common for customers to measure larger than they need. We recommend stopping 1/16" short of the edges. It's better for the top to be a little smaller than too large.

Measure both sides of the furniture surface along the length and width from edge to edge of where you want the acrylic to be. Measure to the nearest 1/16".
